Subject:

Tier 2 NMOC Emissions Report

White Street Landfill Greensboro, North Carolina

### Dear Greg:

SCS Engineers, PC (SCS) is pleased to submit four copies of the Tier 2 non-methane organic compound (NMOC) report for the White Street Landfill. SCS personnel performed the Tier 2 field testing on June 15, 2004 in general accordance with the NCDENR-approved sampling protocol prepared on behalf of the City of Greensboro (City) by SCS. As shown in the report, the sampling and analysis indicate the NMOC emissions for the White Street Landfill exceed the 50 Mg/year threshold established by the New Source Performance Standards (NSPS). Our report concludes that the City has two options as a result of the NMOC emissions. These options are:

- 1. Conduct Tier 3 methane generation rate sampling and analysis as provided in 40 CFR 60.754(a)(4) in hopes of lowering the site-specific k constant; or,
- 2. Submit a Gas Collection and Control System Design Plan (GCCS Design Plan) within one year of the emissions exceedance date in accordance with 40 CFR 60.752(b)(2)(i). As we understand it, the due date of the GCCS Design Plan is May 18, 2005.

Based on SCS's experience, Tier 3 testing can be a costly process that often does not produce the desired results (i.e., significantly lowering the site's NMOC concentration). For these reasons, SCS does not recommend a Tier 3 test for the White Street Landfill.

As discussed, SCS plans to meet with the City next week to discuss this report and future NSPS-related activities. We will contact you in a few days to arrange the meeting. In the meantime, if you have any questions regarding this report, please do not hesitate to contact either Erin Conklin at 478-284-9392, or Steve Lamb at 704-377-4766.

Sincerely,

Erin C. Conklin Staff Engineer

### **CERTIFICATION STATEMENT**

This Tier 2 NMOC Emissions Rate Report has been prepared for the White Street Landfill by SCS Engineers, PC on behalf of the City of Greensboro. This report was prepared for compliance with the New Source Performance Standards (NSPS) 40 CFR 60, Subpart WWW – Standards of Performance for Municipal Solid Waste Landfills – in accordance with the NSPS.

### INTRODUCTION

On March 12,1996, the Environmental Protection Agency (EPA) promulgated the New Source Performance Standards (NSPS) and Emissions Guidelines (EG) for new and existing landfills under Section III (b) of the Clean Air Act (CAA). The basis for this legislation is EPA's determination that municipal solid waste (MSW) landfills contribute significant amounts of air pollution that is potentially detrimental to public health. The NSPS are intended to control non-methane organic compound (NMOC) and methanogenic emissions from MSW landfills. NMOCs include volatile organic compounds (VOCs), hazardous air pollutants (HAPs), and odorous compounds. The NSPS applies to landfills having a design capacity greater than 2.5 million Megagrams (Mg) (2.75 million tons), that were permitted, modified, or reconstructed after May 30, 1991.

The City of Greensboro (City) owns and operates the White Street Landfill (Landfill). The Landfill is regulated under the NSPS based upon both a design capacity exceeding 2.5 million Mg and a Tier 1 NMOC emission rate calculation which demonstrated an annual NMOC emission rate exceeding 50 Mg (55 tons) per year. Section 60.757(c)(1) states that if the Tier 1 analysis results in NMOC emissions greater than 50 Mg per year, a revised NMOC Emission Rate Report can be submitted using data gathered from a site-specific, Tier 2 analysis.

In April 1999, Tier 2 testing was conducted by SCS Engineers, PC (SCS) at the Landfill. Results of the April 1999 Tier 2 indicated NMOC emissions through April 2004 to be less than 50 Mg/year, so the Landfill was not required to install an NSPS-compliant gas collection and control system (GCCS). Since Tier 2 results are only valid for five years, the City retained SCS to conduct a new Tier 2 NMOC emissions test in 2004. This report summarizes the results of the new Tier 2 analysis.

This Tier 2 report was prepared by SCS on behalf of the City to quantify the NMOC emissions for compliance with the NSPS (40 CFR Part 60, Subpart WWW) by presenting Tier 2 sampling, analysis, and a revised NMOC emissions estimate. This report includes sections describing the field sampling procedures and activities, the results of the laboratory analysis, estimates of current and projected annual NMOC emissions, and overall conclusions.

### SITE BACKGROUND

The Landfill (Solid Waste Permit No. 41-03) encompasses an area of approximately 767 acres within the city limits in the northeast quadrant of the City, at the east end of White Street. The Landfill is used for the disposal of MSW generated within the City and Guilford County. Beginning in 1943, waste disposal at the Landfill consisted primarily of incineration. Burning operations ceased in 1965, and since that time refuse has been buried on site.

White Street Landfill consists of several distinct municipal solid waste (MSW) landfill areas, which for the purpose of this compliance issue, are grouped into three phases: Phase I, Phase II and Phase III. Phase I is the oldest of the three areas. It is approximately 65 acres in size and contains land clearing and inert debris (LCID) deposited on top of MSW. This phase was filled with MSW between the years 1965 and 1978 and contains approximately 3.0 million tons of MSW. The City began disposing of LCID on top of the MSW in 1999 and is currently continuing this activity. Phase I does not have a landfill gas (LFG) collection system.

Phase II is an unlined, 145-acre area that received approximately 5.4 million tons of MSW from 1978 to 1997. A comprehensive active LFG extraction system is installed and operated by Duke Engineering and Services (DES) in this phase. LFG from Phase II is collected and either conveyed to Cone Mills via a transmission pipeline, or flared at the Phase II blower/flare station.

Phase III, a subtitle-D lined, 52-acre area, began receiving waste in 1997. Phase III consists of three cells. Cell 1 is approximately 25 acres in size and contains eight horizontal collectors that convey LFG to a passive flare. Cell 2 is approximately 15 acres in size and is the current active portion of the Landfill. Cell 2 contains seven horizontal LFG collectors that are not connected to a flare at this time. However, in the next several months, the City will be connecting the collectors from Cells 1 and 2 to a new blower/flare station located just east of Phase III. Cell 3 is approximately 12 acres in size and filling has not yet begun in this area.

### **TIER 2 NMOC SAMPLING**

SCS performed site-specific Tier 2 NMOC field sampling for the White Street Landfill on June 15, 2004, in accordance with procedures outlined in the NSPS and SCS's sampling protocol. A copy of the Tier 2 sampling protocol prepared by SCS is provided in Appendix A. In addition, the North Carolina Department of the Environment and Natural Resources (NCDENR) approved the methodology of the sampling protocol prior to the field sampling. The approval letter from NCDENR is included in Appendix B.

### **Field Sampling Procedures**

In the Tier 2 sampling protocol, SCS requested that the EPA and NCDENR consider a minor modification for the Tier 2 sampling program at the White Street Landfill. Subpart WWW, section 60.754 (a) (3) requires at least two LFG samples be collected per hectare (2.47 acres) of landfill surface that has retained waste for at least two years. Since the Landfill consists of three distinct phases, the sampling procedure for each phase is different. Refer to Appendix A for more information.

### **Tier 2 Field Sampling Activities**

The Tier 2 NMOC field samples were collected at the Landfill on June 15, 2004. Present at the site during the sampling activities were representatives from the City and SCS. Prior to sampling, SCS personnel verified with Landfill personnel that the active LFG collection system in Phase II was operating normally and all applicable wells and collectors had applied vacuum at the time of the Tier 2 test. Pursuant to the above referenced sampling "procedure", the following samples were obtained:

- Three representative LFG samples were obtained from the main header upstream from the existing blower and condensate knockout in Phase II;
- Three representative LFG samples were obtained from the header upstream of the flame arrestor and passive flare in Phase III, Cell 1; and,
- Seven samples were obtained from the passive horizontal collectors in Phase III, Cell 2.

Although sampling LFG from Phase I was included in the sampling protocol, SCS did not obtain LFG samples from Phase I. Phase I sampling was postponed pending the results and our analysis of the Phase II and III samples.

The sampling locations are shown in Appendix C. Field equipment used during the sampling activities included a LandTec® GEM 500 Infrared Gas Analyzer, an EPA Method 25 C approved sampling train with an attached Cole-Palmer® digital pressure gauge, and nine 6-liter stainless steel SUMMA sample canisters. In accordance with EPA Method 25 C, the sampling apparatus was connected to the LFG sample port and purged using the GEM unit.

Once valid LFG readings were verified, approximately 3 liters of LFG were collected into each SUMMA canister at a maximum rate of 500 ml/min. An individual SUMMA canister was used for each of the six LFG header samples collected in Phase II and Phase III, Cell 1, and composite sampling into three SUMMA canisters was used in Phase III, Cell 2.

SCS shipped the LFG sample canisters to AtmAA, Inc. (AtmAA) in Calabasas, California, for subsequent analysis. Appendix D contains the Tier 2 sampling logs and AtmAA chain of custody forms.

### TIER 2 NMOC LABORATORY ANALYSIS AND EMISSIONS ESTIMATE

### **Tier 2 Laboratory Analytical Results**

A laboratory analysis of the LFG samples was performed by AtmAA using EPA Methods 25C and 3C. Measured NMOC concentrations from the SUMMA canisters were

corrected for moisture and nitrogen per standard procedures. SCS provided AtmAA with the field conditions (temperature and barometric pressure) at the time of LFG sampling to achieve an accurate calculation of the NMOC concentration.

Based on the laboratory results, the Landfill's average NMOC concentration for Phase II is **4,047** ppmv, for Phase III, Cell 1 is **7,842** ppmv and for Phase III, Cell 2 is **3,843** ppmv, all reported as carbon. Since the EPA Landfill Air Emissions Estimation Model (LAEEM) requires the input of the NMOC concentration in terms of hexane, the laboratory NMOC concentration in terms of carbon was converted to hexane by dividing by six. This resulted in an average NMOC concentration of **675** ppmv as hexane in Phase III, **1,307** ppmv as hexane in Phase III, Cell 1, and **640** ppmv as hexane in Phase III, Cell 2. These site-specific NMOC concentrations are used in evaluating the Landfill's revised NMOC emissions.

$$NMOCConc_{PhaseII} = \left(\frac{3,993\,ppmv + 3,937\,ppmv + 4,210\,ppmv}{3}\right) = \left(\frac{4,047\,ppmv_{carbon}}{6}\right) = 675\,ppmv_{hexane}$$

$$NMOCConc_{\textit{PhaseIII},Cell1} = \left(\frac{7,696\,ppmv + 7,825\,ppmv + 8,004\,ppmv}{3}\right) = \left(\frac{7,842\,ppmv_{\textit{carbon}}}{6}\right) = 1,307\,ppmv_{\textit{hexane}}$$

$$NMOCConc_{PhaseIII,Cell2} = \left(\frac{(3,433\,ppmv*3) + (4,731\,ppmv*3) + (2,407\,ppmv*1)}{7}\right) = \left(\frac{3,843\,ppmv_{carbon}}{6}\right) = 640\,ppmv_{hexane}$$

**EXHIBIT 1. NMOC LABORATORY SUMMARY** 

Sample Identification	Sample	NMOC Carbon	NMOC Hexane
Number	Description	(ppmv)	(ppmv)
WSL-061504-01	Phase II Header Sample	3,993	666
WSL-061504-02	Phase II Header Sample	3,937	656
WSL-061504-03	Phase II Header Sample	4,210	702
WSL-061504-04	Phase III, Cell 1 Header Sample	7,696	1,283
WSL-061504-05	Phase III, Cell 1 Header Sample	7,825	1,304
WSL-061504-06	Phase III, Cell 1 Header Sample	8,004	1,334
WSL-061504-04	Phase III, Cell 2 Collector Sample	3,433	572
WSL-061504-04	Phase III, Cell 2 Collector Sample	4,731	789
WSL-061504-04	Phase III, Cell 2 Collector Sample	2,407	401

### **Tier 2 Landfill Emissions Estimation Model Outputs**

The Tier 2 NMOC emissions estimates for the Landfill (Phases II and III only) were performed using the EPA LAEEM. The model inputs established in Section 60.754(a)(1), the site's field-derived average NMOC concentrations, and the refuse fill history of the facility were used to perform the Tier 2 models and are as follows:

- Methane Generation Potential (Lo) 170.0 m<sup>3</sup>/Mg. (Default value cited by NSPS)
- Methane Generation Rate Constant (k) -0.05 1/year. (Default value cited by NSPS)
- Phase II NMOC Concentration 675 ppmv as hexane. (Field sampling values)
   Phase III, Cell 1 NMOC Concentration 1,307 ppmv as hexane
   Phase III, Cell 2 NMOC Concentration 640 ppmv as hexane
- Refuse Filling History SCS used tonnage records provided by the City, and estimated by projecting waste disposal based upon a five percent yearly increase.

According to the EPA LAEEM, the 2004 NMOC emissions from Phases II and III exceed the 50 Mg/year threshold for the Landfill. Since the NMOC emissions exceed the 50 Mg/year threshold for Phases II and III, site-specific NMOC testing for Phase I was not conducted. Copies of the Tier II model outputs are included in Appendix F. The results of the models are summarized below in Exhibit 2.

**EXHIBIT 2. NMOC EMISSIONS ESTIMATE** 

Year	Site-Wide Refuse In-Place (tons)	Phase II NMOC Generation Rates (Mg/yr)	Phase III, Cell 1 NMOC Generation Rates (Mg/yr)	Phase III, Cell 2 NMOC Generation Rates (Mg/yr)	Phases II & III NMOC Generation Rates (Mg/yr)
2004	10,075,048	97	55	20	172
2005	10,210,501	92	53	23	168
2006	10,351,991	87	50	27	164
2007	10,500,556	83	48	30	161
2008	10,656,549	79	45	34	158

### **CONCLUSIONS AND RECOMMENDATIONS**

Since the Landfill has exceeded the 50 Mg/year NMOC emission rate, one of the following options must now be implemented.

- Conduct Tier 3 methane generation rate sampling and analysis as provided in 40 CFR §60.754(a)(4) in hopes of lowering the site-specific k constant; or,
- Submit a GCCS design plan prepared by a professional engineer within one year of the emissions exceedance date in accordance with 40 CFR §60.752(b)(2)(i), namely May 18, 2005. Installation of the GCCS must be complete within 18 months after the submittal of the design plan (November 18, 2006).

It should be noted that Tier 3 testing can be a costly process that often does not produce the desired results (i.e., significantly lowering the site's NMOC concentration). For these reasons, SCS rarely recommends this type of testing and does not recommend a Tier 3 for the White Street Landfill.

## APPENDIX A

SCS SAMPLING PROTOCOL AND SIGNIFICANT CORRESPONDENCE

### SCS ENGINEERS, PC

April 28, 2004 File No. 02203314.00

Subject:

**NSPS Tier 2 Sampling Protocol** 

White Street Landfill - Greensboro, North Carolina

Dear Mr. O'Neal:

SCS Engineers, PC (SCS) is pleased to submit the testing protocol for Tier 2 sampling at the White Street Landfill (Landfill) in Greensboro, North Carolina. The Landfill is regulated according to the U.S. Environmental Protection Agency's (EPA's) New Source Performance Standards (NSPS) for Municipal Solid Waste Landfills. Using Tier 1 defaults provided in the EPA's Landfill Gas Emission Model (LandGEM), the Landfill's estimated non-methane organic compound (NMOC) emissions were greater than 50 Megagrams (Mg) per year. As a result, Tier 2 sampling was performed in April 1999 by SCS Engineers to establish a site-specific NMOC concentration. Since the site-specific NMOC concentration is only valid for five years, SCS will determine a new site-specific NMOC concentration for the Landfill using EPA Method 25C (i.e., Tier 2 sampling).

Accordingly, SCS has developed a sampling protocol to determine the site-specific NMOC concentration in the LFG at the Landfill. A complete discussion of the proposed sampling program is included as Attachment A for your review and approval.

If you have any questions about this submittal, please feel free to call either of the undersigned at (704) 377-4766.

Very truly yours,

Erin C. Conklin/scl

Staff Engineer

**NSPS Tier 2 Sampling Protocol** 

White Street Landfill - Greensboro, North Carolina

Dear Mr. Stewart:

SCS Engineers, PC (SCS) is pleased to submit the testing protocol for Tier 2 sampling at the White Street Landfill (Landfill) in Greensboro, North Carolina. The Landfill is regulated according to the U.S. Environmental Protection Agency's (EPA's) New Source Performance Standards (NSPS) for Municipal Solid Waste Landfills. Using Tier 1 defaults provided in the EPA's Landfill Gas Emission Model (LandGEM), the Landfill's estimated non-methane organic compound (NMOC) emissions were greater than 50 Megagrams (Mg) per year. As a result, Tier 2 sampling was performed in April 1999 by SCS Engineers to establish a site-specific NMOC concentration. Since the site-specific NMOC concentration is only valid for five years, SCS will determine a new site-specific NMOC concentration for the Landfill using EPA Method 25C (i.e., Tier 2 sampling).

Accordingly, SCS has developed a sampling protocol to determine the site-specific NMOC concentration in the LFG at the Landfill. A complete discussion of the proposed sampling program is included as Attachment A for your review and approval.

If you have any questions about this submittal, please feel free to call either of the undersigned at (704) 377-4766.

Very truly yours,

### ATTACHMENT A

### TIER 2 SAMPLING PROTOCOL WHITE STREET LANDFILL GREENSBORO, NORTH CAROLINA

This protocol describes the method for selecting sample locations and the procedures for collecting landfill gas (LFG) samples at White Street Landfill located in Greensboro, North Carolina. The purpose of the sampling is to establish a site-specific non-methane organic compound (NMOC) concentration in the LFG for use in determining the applicability of the New Source Performance Standards (NSPS) to LFG collection at the White Street Landfill.

This protocol was prepared by SCS Engineers, PC (SCS) on behalf of the City of Greensboro and the White Street Landfill.

### **BACKGROUND**

White Street Landfill consists of several distinct municipal solid waste (MSW) landfill areas, which for the purpose of this compliance issue, are grouped into three phases: Phase I, Phase II and Phase III. Phase I is the oldest of the three areas. It is approximately 65 acres in size and contains land clearing and inert debris (LCID) deposited on top of MSW. This phase was filled with MSW between the years 1965 and 1978 and contains approximately 3.0 million tons of MSW. The City of Greensboro (City) began disposing of LCID on top of the MSW in 1999 and is currently continuing this activity. Phase I does not have a LFG collection system.

Phase II is an unlined, 145-acre area that received approximately 5.4 million tons of MSW from 1978 to 1998. A comprehensive active LFG extraction system is installed and operated by Duke Engineering and Services (DES) in this phase. LFG from Phase II is collected and either conveyed to Cone Mills via a transmission pipeline, or flared at the Phase II blower/flare station.

Phase III, a subtitle-D lined, 52-acre area, began receiving waste in 1997. Phase III consists of three cells. Cell 1 is approximately 25 acres in size and contains a horizontal collector gas extraction system that conveys LFG to a passive flare. Cell 2 is approximately 15 acres in size and is the current active portion of the landfill. Cell 2 contains five horizontal LFG collectors that are not connected to a flare at this time. However, in the next few months, the City of Greensboro will be connecting the collectors from Cells 1 to a new blower/flare station located next to Phase III. Cell 3 is approximately 12 acres in size and filling has not yet begun in this area.

### **SAMPLE LOCATIONS**

Section 60.754(a)(3) of the NSPS for municipal solid waste landfills states that when conducting Tier 2 testing, the landfill owner must install at least two sample probes per hectare (2.47 acres) of landfill surface that has retained waste for at least two years. However, if the landfill is larger than 25 hectares in area, only 50 samples are required.

The total landfilled area at White Street Landfill is approximately 250 acres (101 hectares). Since the area of landfill at the site is greater than 25 hectares, 50 probes are required. To space the probes evenly across the landfill, a probe density of 1 probe per 5 acres is necessary. This would result in 13 probes in the 65-acre Phase I area, 29 probes in the 145-acre Phase II area, and eight probes in the Phase III area.

### PHASE I PROBED SAMPLES

Samples from Phase I will be collected using the pilot probe procedure described in U.S. EPA Method 25C. SCS will use composite sampling as allowed under §60.574(b)(3). A maximum of five samples will be collected into a single canister, with each sample being of equal volume. Since the MSW in Phase I has been mostly overfilled by LCID, SCS intends to composite samples in this phase from the area that has not been overfilled by LCID. By collecting samples from this area, SCS will be avoiding areas of known nondegradable solid waste, as specified in §60.574(a)(3). Each sample probe will be installed to a depth of at least one meter below the bottom of the landfill cap, which is estimated to be two to three feet thick. The maximum probe depth will be approximately 12 feet (3.7 meters). A direct-push (geoprobe) rig will be used to install the probes. After pushing the pilot probe to the required depth, the pilot probe will be removed and a stainless steel sampling probe will be installed in the pilot hole. The sampling probe will be capped at the bottom, and the bottom one-third will be perforated. A threaded cap and sampling attachment will be connected to the top of the probe. The annular space around the probe at the top of the hole will be filled with soil from the existing landfill cap.

The sampling train will be in accordance with Method 25C and include the following components: teflon tubing, purge pump or vacuum tank, sampling valves, rotameter, vacuum gauge and a pre-evacuated six-liter stainless steel SUMMA canister.

The sampling procedure will be in accordance with Section 4.4 of Method 25C. A purge pump or vacuum tank will be used to evacuate at least two probe volumes at a flow rate of 500 milliliters per minute (ml/min) or less. After purging, a Landtec GEM-500 gas monitor will be used to measure the volumetric concentrations of methane, carbon dioxide, oxygen and balance gas, which is assumed to be almost entirely nitrogen. The purpose of measuring gas quality with the GEM-500 is to ensure that the nitrogen concentration is less than 20 percent as required by Method 25C. The oxygen reading is also important in the case where the LFG contains a high concentration of residual nitrogen.

U.S. EPA is aware of the potential of high residual nitrogen in some landfills and has amended Method 25C to address this issue. After checking the gas quality, the sample valves will be turned so that LFG will only flow to the SUMMA canister, and the rotameter will be closed. The valve on the canister will be opened and the rotameter adjusted to allow a sampling flow rate of 500 ml/min or less. During sampling, the sampling data such as canister vacuum, sampling time and flow rate, etc. will be recorded. After one liter of gas is collected, the canister will be closed and the sampling probe removed. The abandoned hole

will be filled with soil. As mentioned earlier, equal volumes of LFG samples will be composited into canisters at a maximum rate of three samples per six-liter canister.

### PHASE II HEADER SAMPLES

Because a comprehensive LFG collection system is installed in Phase II, SCS proposes to collect gas samples from the main LFG header instead of using shallow probes. This method was previously used five years ago at this site and has since been clarified in the Federal Register Section 60.754, dated October 17, 2000. The LFG samples will be taken at a location along the header between Phase II and the blower/flare station, prior to the main condensate knockout tank. Three samples of at least three liters each will be collected into separate canisters from the sample location. In past guidance, EPA has stated that three samples should be taken when sampling using this alternative procedure. This approach is also consistent with the sampling method suggested in §60.754(b)(2) for determining NMOC concentrations at landfills seeking to determine if the collection systems can be shut down as provided in §60.752(b)(2)(v). Since the LFG collection system influences a larger volume of refuse than would probes installed one meter into the refuse, it is reasonable to expect a more representative gas sample from the LFG collection system than would be provided by shallow probes.

### PHASE III HEADER SAMPLES

Currently, Phase III, Cell 1 has eight horizontal LFG collectors that run north to south in the cell and are overlain with approximately 30 feet of MSW. These horizontal LFG collectors are connected to a temporary aboveground header pipe that conveys LFG to a passive flare. In the next few weeks, the City of Greensboro is connecting these horizontal collectors to the Phase III blower flare station by installing a permanent belowground header pipe. Rather than install shallow probes in this landfill area, SCS proposes to collect LFG samples from the permanent header in the manner described in the sampling procedure for Phase II above (e.g. three samples of at least three liters each). Since the LFG collection system influences a larger volume of refuse than would probes installed one meter into the refuse, it is reasonable to expect a more representative gas sample from the LFG collection system than would be provided by shallow probes.

Phase III, Cell 2 has five horizontal collectors that run north to south in the cell and are overlain with approximately 30 feet of MSW. Rather than install shallow probes in this landfill area, SCS proposes to collect LFG samples from each horizontal collector. The five samples collected will be composited into two SUMMA canister as allowed under  $\S60.574(b)(3)$ . Because these collectors are relatively deep and directly influence a greater volume of refuse than shallow probes, samples taken from the collectors will be more representative of the overall LFG quality than samples taken from probes. This is similar to the rationale for sampling from the main LFG collection system header described above, and has been approved by U.S. EPA as an acceptable approach on numerous occasions.

### SAFETY CONSIDERATIONS

Landfill gas contains methane and therefore is potentially explosive. SCS personnel are experienced with landfill operations, LFG collection systems, and the proper sampling and handling of LFG. Standard safety precautions include refraining from smoking or creating sparks near the test site and using explosion-proof equipment. SCS will follow safety precautions outlined in EPA Method 25C.

No special safety equipment is required for the test. However, all testing personnel will wear clothing appropriate for a landfill environment such as steel-toed boots and long pants. Hard hats, ear protection, and eye protection are not specifically required by the Landfill at the testing site; however, all testing personnel will have such equipment available to use, as needed based on field conditions.

### LABORATORY ANALYSIS

Samples will be shipped to a laboratory for NMOC analysis per Method 25C and nitrogen and oxygen analysis per Method 3C. The resulting site-specific NMOC concentrations will then be used in EPA's Landfill Gas Emission Model to calculate the Tier 2 NMOC emissions. Note that the analytical results of the three samples from the LFG collection header in Phase II will be averaged; the average NMOC concentration is the one that will be used to model NMOC generation from Phase II. Likewise, the average NMOC concentration from the probed samples will be used to model NMOC generation from Phase I and the average weighted concentration from the samples collected in the two cells in Phase III will be used to estimate NMOC generation from Phase III.

### **AUDIT SAMPLES**

While Method 25C includes a provision for the possible use of audit samples, it is our understanding through numerous conversations with U.S. EPA that since an audit sample appropriate for EPA Method 25C has not yet been developed, they are not recommending their use at this time. Furthermore, EPA recommends against using any substitute audit sample (such as one for Method 25) in its place, since the organic components may not be appropriate. In addition, EPA has not yet established pass-fail criteria for a Method 25C audit sample. For the reasons stated above, audit samples will not be used for the Tier 2 sampling and analysis.

### **FINAL REPORT**

Upon completion of the sampling and analysis, a Tier 2 NMOC emission estimate report will be prepared and submitted to the North Carolina Department of Environment and Natural Resources (NCDENR). This report will include the following:

- Letter report summarizing the fieldwork, lab results, and NMOC emission calculations;
- Copies of significant correspondence between SCS and NCDENR;

- Copies of field sampling forms;
- Copy of lab data report including the chain of custody;
- Site plan showing the sample locations; and,
- LandGEM modeling and appropriate calculations.

May 4, 2004 File No. 02203314.00

Mr. Gregg O'Neal North Carolina Department of Environment and Natural Resources Division of Air Quality 1641 Mail Service Center Raleigh, North Carolina 27699-1641

Subject:

NSPS Tier 2 Sampling Protocol - Additional Information

White Street Landfill - Greensboro, North Carolina

Dear Mr. O'Neal:

SCS Engineers, PC (SCS) is pleased to submit the testing protocol form for Tier 2 sampling at the White Street Landfill (Landfill) in Greensboro, North Carolina. This submittal is per your telephone request on April 29, 2004. Please attach the enclosed information to the previous submittal of Attachment A, Tier 2 sampling protocol.

If you have any questions about this submittal, please feel free to call either of the undersigned at (704) 377-4766.

Very truly yours,

Erry C. Corblin / SUL

Purpose: facility,

The primary goals of the Protocol Submittal Form are to initiate communication between representatives of the permitted the testing consultants, and the DAQ as well as to identify and resolve any specific testing concerns prior to testing.

Instructions: Submit all forms and additional information to the DAO Regional Supervisor at least 45 days prior to testing. Please type or print clearly. Complete one form for each sampling location. If this form does not supply sufficient space to completely

answer all questions or if additional relevant information is necessary, attach additional documentation and/or information to the original form. Questions and/or comments should be directed to the appropriate Regional Supervisor.

to the original form. Question This form is avail	is and/or comments s able from the DAQ	should be dir website (ht	ected to the app p://daq.state.n	propriate l c.us/enf/s	Regional Superv sourcetest/)	isor.

NCDENR SAMPLING PROTOCOL APPROVAL LETTER

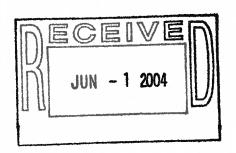

# North Carolina Department of Environment and Natural Resources Division of Air Quality

Michael F. Easley, Governor

William G. Ross, Jr., Secretary B. Keith Overcash, P.E., Director

May 20, 2004

Mr. Greg Thomasson, P.E.
Technical and Planning Support Manager
City of Greensboro
P.O. Box 3136
Greensboro, NC 27402-3136

**Guilford County** 

Subject: City of Greensboro - White Street Landfill, Facility ID 04-41-01086

Greensboro, Guilford County, North Carolina, Air Permit 08830T01,

Protocol for 5-Year Nonmethane Organic Compounds (NMOC) Tier 2 Emissions Retest of the

NSPS Subpart WWW, Nonactive Portions of Landfill (ID Nos. ES-1 and ES-2) and

Active Portion of Landfill (ID No. ES-3), Phases I, II, and III

For a Revised Site-Specific NMOC Concentration and NMOC Emissions Rate

Submitted by SCS ENGINEERS, PC - Charlotte, NC

Proposed Test Date: First Week of June, 2004

### Dear Mr. Thomasson:

The emissions test protocol for the subject landfill gas collection system has been reviewed. Testing will quantify the NMOC emissions for compliance with 40 CFR 60 Subpart WWW, Standards of Performance for Municipal Solid Waste Landfills. The table below lists the pollutants and test methods:

Target Pollutant	Proposed Test Method
Carbon Dioxide and Oxygen	USEPA Method 3C: Determination of Carbon Dioxide, Methane, Nitrogen, and Oxygen from Stationary Sources (Sampling concurrent with USEPA Method 25C testing.)
NMOC	USEPA Method 25C: Determination of Nonmethane Organic Compounds (NMOC) in Landfill Gases (Sampling concurrent with USEPA Method 3C testing.) ES-1 and ES-3 cell 2 will be sampled using composite equal volume sampling collected from 13 (ES-1) sample probes and 6 (ES-3 cell 2) passive horizontal gas collectors. ES-2 and ES-3 cell 1, sampling will require 3 separate sample collections from each common header test location.

Note: Composite sampling will be conducted for ES-1 phase I and ES-3 phase III cell 2. When composite sampling, an equal volume must be collected from each of the sample probes. ES-2 phase II and ES-3 phase III cell 1 will each be sampled from a common header pipe location. A minimum of 3 separate samples should be collected at each common header test location.

**Technical Services Section** 

1641 Mail Service Center, Raleigh, North Carolina 27699-1641 2728 Capital Blvd., Raleigh, North Carolina 27604 Phone: 919-733-1728 / FAX 919-733-1812 / Internet: www.ncair.org

Mr. Greg Thomasson, P.E., City of Greensboro May 20, 2004 Page 2 (White Street Landfill, 5-Year NMOC Tier 2 Emissions Retesting ES-1, ES-2, and ES-3)

The test protocol is approved. USEPA Region 4 has approved composite sampling from the six phase III cell 2 passive horizontal gas collectors, since this approach should provide sampling that is as representative as the two sampling probes per hectare requirement. Therefore, composite sampling from the phase III cell 2 passive horizontal gas collectors will be considered representative.

ES-1 phase I and ES-3 phase III cell 2 will be sampled using composite sampling with an equal volume of sample collected at each of the 13 ES-1 sample probes and from each of the ES-3 cell 2 sample probes (6 passive horizontal gas collectors). ES-2 and ES-3, phase II and phase III cell 1 respectively, will each be sampled at a common header pipe location since both of these phases have landfill gas collection systems. When emissions testing at a common header pipe location, a minimum of 3 separate samples should be collected atteach common header test location.

White Street Landfill shall be responsible for ensuring, within the limits of practicality, that the landfill gas collection systems are operated at or near the maximum normal process rate. The final test report will include information to establish that the near maximum normal requirement was met during the test period.

The proposed methods are acceptable. Approval of the testing proposals does not exempt the tester, in any way, from the minimum requirements of the applicable test methods. Any deviations from the applicable methodologies remain subject to the approval of the Division of Air Quality and the USEPA. If there are any additional questions concerning this matter, please contact me at (919) 715-0251 or at Gregg.Oneal@ncmail.net.

Sincerely,

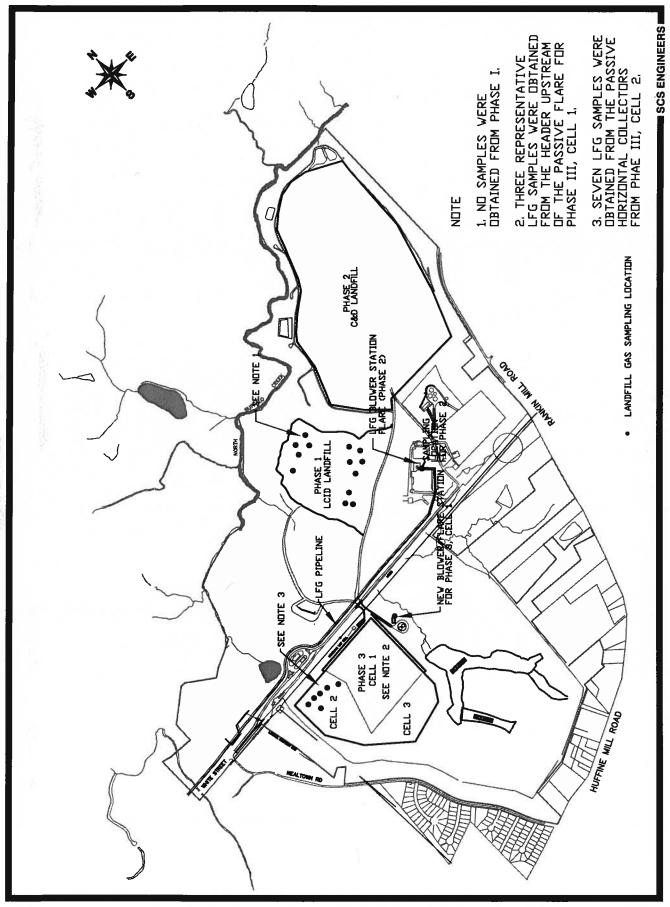

Thomas G. O'Neal, III, P.E.

re: White Street Landfill

Dear Erin:

Please find enclosed the laboratory analysis report, data package, and the original chain of custody forms for a total of nine SUMMA canister samples received June 16, 2004.

The samples were analyzed according to EPA Method 25C and EPA Method 3C, for TGNMO, nitrogen, and oxygen.

Sincerely,

AtmAA, Inc.

Michael L. Porter Laboratory Director

Encl. MLP/bwf

23917 Craftsman Rd., Calabasas, CA 91302 • (818) 223-3277 • FAX (818) 223-8250

#### LABORATORY ANALYSIS REPORT

Total Gaseous Non-Methane Organics (TGNMO), Nitrogen, and Oxygen Analysis in SUMMA Canister Samples

Report Date: June 30, 2004

Client: SCS Engineers

Site: White Street Landfill

Project No.: 02203314.00 Date Received: June 16, 2004

Date Analyzed: June 17, 18, 21, & 22, 2004

Instrumental Operator: Michael S. Porter

#### **ANALYSIS DESCRIPTION**

Total gaseous non-methane organics in SUMMA canisters was measured by flame ionization detection/ total combustion analysis (FID/TCA), EPA Method 25C. Nitrogen and oxygen were measured by thermal conductivity detection/ gas chromatography (TCD/GC), EPA Method 3C.

AtmAA	Sample

01684-14	wsl-061504-09	0.43	4.02	2407

TGNMO is total gaseous non-methane organics measured and reported as ppm methane. The reported oxygen concentration includes any argon present in the sample, calibration is based on a standard atmosphere containing 20.95% oxygen and 0.93% argon.

Note: Site barometric pressures and site temperatures which were recorded on the submitted chain of custody, were used in the concentration calculations.

Michael L. Porter Laboratory Director Date: June 30, 2004
